

Introduction

The purpose of the **SMART WORLD** creation is made new tools for servicing the humans and to transfer the traditional financial system (centralized) into the smart financial system (decentralized) which is not controlled by any institutions because we don't need any governments or their rules at all.

Our vision is to present the smart world where not only the programmers can communicate with its services but also do the ordinary people. We endeavor for Democracy and privacy empowering.

SMART WORLD starts with some primary and powerful projects, the providers and the developers team are exhibited the services unlimitedly.

Overview

The preliminary capital provision is done without any initial coin offering. The whole primitive fund is provided by the personal investment.

The project commits to not accepting any business partner in the future therefore we will not have to implement any instructions or the government policies.

SMART WORLD controls the domestic network token (STT) division and its generation; you cannot produce it manually at all.

We believe that we are in the most primitive age of the Internet, The period which most of the people just accessing to the web. But there is a long way to the most valuable Internet goal, the free Internet accessing for all the people. When BITCOIN becomes the banks backed and TWITTER or FACEBOOK can no longer decide about our received information.

SMART WORLD wants to spend for the INTERNET FREEDOM, instead of attempting for making more money.

The world financial system will be written from the scratch once in every few centuries. The BITCOIN initiation and implementation scheme has been established the new financial system which we are specified and controlled its rules. Now we want to accelerate and fight for this financial democracy.

PLATFORMS

The basic foundation of the system is built on BINANCE SMART CHAIN, which has the broadness services and the needful scalability.

Satoshi Nakamoto, the BITCOIN creator, told in one of his last messages: "now you can lead this revolution without me." That revolution wants to eradicate banks and Amazon can no longer stop any applications. We interact with some block chains that Amazon has been presented their domain and the information stored host.

Let's be a little more realistic, ETHERUEM can still work because the governments and Amazon didn't decide to ban it. There is a bridge between the governments, the powers, the banks and BITCOIN, democracy and the people efforts which Amazon, Face Book and twitter are its security guard, They're done it well!

Now there is a silver lining for sending our power and message to the other side of the bridge without the world great Internet power helping. DFINITY INTERNET COMPUTER (ICP) is a blockchain that can make the real decentralized cryptocurrency world. If we want to reach the BITCOIN aim, The INTERNET FREEDOM and the financial democracy, we must help the initial BITCOIN platform more than anything. We can rescue it by ICP before the governments understand BITCOIN and the cryptocurrencies power.

The domestic SMART WORLD token includes backing so BINANCE SMART CHAIN has the STT backed preservation task.

Expansivable by people

SMART WORLD controls the required financial exchanges by receiving the information from the other project contracts as the smart central contract or the bank controller, It generates and distributes the system native token (STT) in the completely decentralized way.

We are trying to beget a platform that the **SMART WORLD** project developer's development is controlled by the smart contract, If the project confirms by voting and adds to the bank controller The bonus will be directly sent to the developers. That's our honor to work with those who take the time to support our cause.

Additionally, we will offer the services which allow the ordinary people to create their darling token, Shop it on instagram and gift crypto to their partner with no special programming knowledge. All in all is the smart global development.

The Smart world control

The STTS holders should definitely control the **SMART WORLD** project which includes the general decisions, adding a new service or any other voting. Only ones with at least one complete STTS can participate in a voting process.

Maybe the creators share unpredictable polls; it is applied by the holders' predicted authority usage. The voters' impact is considered not only by the individuals number but also by their assets.

If our token or our stable coin is going to trade globally, its backed and the token production path must be decentralized and clear so **SMART WORLD** is an open source project that people can see the computer codes and the stored financial backing.

Yes, it's true! TETER and USDC have provided important services to the cryptocurrency world, but eventually crypto was created to destroy the dollars and the paper currencies. Maybe it's a time for TETER to put aside the lie of the dollar reservation in the bank and uses a real stable coin.

Presence in block chains

SMART WORLD is on BINANCE SMART CHAIN at first and then we're drive toward ICP.

Safe block chains such as BITCOIN, POLKADOT or SOLANA have been developed for the respectable purpose, but what should we do if we want to connect to the both of them? E.g.: we have to give the DOT token to the BINANCE exchange, they promise us that they will never lose our money or be hacked and finally just for the sake of honor they will return to us another taken SOL token on the SOLANA blockchain. It may be imposed any restrictions on the users to keep the governments satisfied along this way.

This deal will be happened only when BINANCE exists, now when we look, we're dealing with some block chains which their tokens are valid only on their own nodes validation. How could the decentralized currency exchange, be centralized?

ICP is a platform which can connect the different block chains on the decentralized global system for the first time. **SMART WORLD** comes to be the entire blockchains swap. The BITCOIN economy certainly required the decentralized Internet to reach its goal. ICP is the launch pad to the **SMART WORLD** zone.

The creators

All those who update our codes, mention our security bugs, all the ones who endeavor for the decentralized world with no expectation are our developers.

We provide the service which no block chains have been done them yet, that's the most important point about our team. We are here to make everything decentralized and more user admiration.

The Governance token sales rule (STTS)

Since STTS has the system governance authority, it must be sold on the the clear predictable process.

The whole STTS number is 100 million. 20 percent of them are traded at first quarter and it will be spent on the system services and its quality updating.

Almost one percent of STTS will be sold for every seven million generated STT. The issued tokens will be active on BINANCE SMART CHAIN forever and they will be exchangeable to the ICP token network by moving **SMART WORLD** to ICP.

Tokens

The domestic STT token

The entire internal **SMART WORLD** payment such as the investors profit is mostly paid by STT. The issued STT number is completely under the smart contract control.

STT is generated and valued inside the computer codes. It must be considerable that the STT price determinant factor is the reserved SATOSHI number at the project fund.

Every 100 SATOSHI (1 BITCOIN) causes the whole issued STT price rises to 1 SATOSHI. Even though hundreds millions STT has been produced, still STT has the price backed.

Every 100 million reserved SATOSHI raises
The whole issued STT price to 1 SATOSHI

The 100 million SATOSHI (1 BITCOIN) which the creators are locked them in the smart contract causes no STT price dropping to at least 1 SATOSHI.

10/000/000 STT < 1 BTC
(Each STT price =2 SATS)

The top example is the condition when 10 million **STT** has been produced and one initial **BITCOIN** is the only system supporter, still the whole issued **STTs** with the specified price (2 **SATS**) involve the backed.

Banks are producing money by gold or dollar backed claiming. Let's teach a little to banks.

5 years back, **BITCOIN** was worth one thousand dollar, the same as the **IPHONE** price, at the present a **BITCOIN** holder can buy 30 or 50 **IPHONES**.

The reserved **BITCOIN** on the **SMART WORLD** backed contract increases the whole **STTs** price to 1 **SATS**.

The question is here! How could one **BITCOIN** increase 1 million issued **STTs** price to 1 **SATS** and in another year all **STTs** price grow to 1 **SATOSHI** only by 1 **BITCOIN** entrance to the project fund?

Here is where the concept of value comes to play!

Banks are produced much money by dollar backing, a daily depreciating currency. **STT** as a digital gold_backed cryptocurrency can always inclusive the price rising and a small amount of **STT** could be added annually.

STTs which have been paid as the interest are only converted to **STTS** and after the conversion so called they are burned, for example if 10 million **STT** issued and we swap 1 million of them to **STTS**, the burnt **STT** will be removed from the market cycle; it means we have 9 million **STT** so the **STT** number is controlled.

STT is investable because you invest on a crypto with the predictable price.

STT has almost the zero price volatility, that's why it can do its most own important task, The **SMART WORLD** stable coin creation.

SMART BITS (STB) is generated by receiving STT, you can participate in the loaning process inside the system and the high profit liquidity pools by STB.

STB = 1 BITS

What is a dollar?

A dollar is made up of some cents. A cent is an indicator which most of the people accept it as a value in the different countries. If you think that the dollar is a stable coin so just take a look over the BITCOIN purchasing power in the last ten years.

What is BITCOIN?

BITCOIN is made up of some SATOSHIs, A BITCOIN is 100 million SATOSHI. ONE BITS is equivalent to 100 SATOSHI, the future stable coin which we have provided on DEFI.

If you have one STB, you can get 100 SATOSHI ten years later.

The STB generation is in the way that the received STT price is determined. For instance we want to convert 17/000 STT with 34/000 SATOSHI value to STB, you will receive the STB stable coin equivalent to 99 percent of the STT price.

Why we use STB?

We don't ask the banks for the gold reserved of the paper which they have gave it to us as money. STB is equal to the paper which **SMART WORLD** issues by BITCOIN supporting, you can ask for the **SMART WORLD** STB fund reserved.

STB brings the real money, BITCOIN, to the DEFI platform and its holders can use the DEFI farm and the **SMART WORLD** project benefits. If you return your STB to **SMART WORLD** after some years

and want to get BITCOIN equivalent to its worth, this request will be done immediately. One percent of the additional received STB instead of burning is converted to BITCOIN so the ones who want to receive the backed BITCOIN of their STB, their request is done so fast.

All the **SMART WORLD** parts are not just about the financial functions. We're seeking for the decentralized service presentation, Such as a decentralized social network. So the point is the necessity to the governance token for deciding about the whole parts of **SMART WORLD**, that token is STTS. 100 million STTS have been only issued.

STTS which is stand for SMART WORLD TOKEN_STOCK is our block chain project stock. STTS or BITCOIN are the **SMART WORLD** suggestion options for STT swapping.

In addition like the other stocks the holders can benefit from their stock price rising, also they must gain the profit as the project stockers such as the SMART swap profit. We explain it more in the SMART swap section.

Investors

The initial capital for starting the project and the liquidity provision are took place by the creators' team moreover one BITCOIN is locked in the project balance. The token fund attraction will be done by the attractive payment profit in all of the world countries. They are the future world investors, the holders and the **SMART WORLD** deciders.

INVESTMENT

People can get STT by BNB, BITCOIN or STTS payment at the investment section.

The STTS price begins from 30 STB, but the market is the price determiner.

For every 500 thousand SATOSHI exchanging, 200 thousand STT token is calculated for the investors as the reward at the registry time, this

will be paid during two years. The referral profit receiving method is the difference between investing in STTS, BNB or BITCOIN.

STB (The SMART WOTLD stable coin)

❖ there popular stable coins:

Stable coin with fiat_backed currencies (bank money)

One dollar is locked in the bank as the backed when a token generated, like Tether USDT or USDC.

Stable coin with crypto currency_backed

As you know the DAI stable coin must save 1.5_fold ETHERUEM for one stable coin production in their contract. Although this situation is much better than dollars storing in a bank, but there are some problems. For example, 50 percent of the stored ETHERUEM is practically unusable in the DAI contract. Still, we cannot be ensuring that there is always a fund equal to the produced tokens number because the digital currencies world has the high price fluctuation. That's indicated the stable coin requirement.

On the other hand TRON, ETHERUEM and their shares could be valuable also they do the bank duties in a modern way but they can't convert their stocks to money. Only when we put the real worth like BITCOIN as the backed, we can claim that we have created money for the real world usage, like the governments who have generated money by gold backed claiming. So ETHERUM can do its own task as the bank but its token can't be money.

Stable coin with no backing

It claims that its price is always one dollar in the same way which banks maintain the money value, supply and demand control, this method is debatable. From our point of view the Stable coin with the traditional money or the fiat backed is a joke with cryptocurrencies; it is not funny at all.

STB STABLE COIN, STBS (SMART BITS)

STB is the future stable coin. **STB** is issued only by the **STT** payment.

The **STB** token is generated from 99 percent of the **STT** payment which is always worth as 100 **SATOSHI** or one **BITS**.

There is some superiority in this method but first you must know **STT** in order to better understand this supremacy.

The mining process is in such a way that the less **STT** is issued by the project asset balance increment.

The token price is determined by the actual fund amount not supply and demand. It is obvious that the price is based on a predictable process rather than the emotional one.

If the **BITCOIN** price suddenly decreases, the **STT** price increases just by adding one **BITCOIN** so it will be compensated the price swing because the **STT** price is specified by the backed **BITCOIN** number and not the **BITCOIN** price.

Now you know the **STT** property, let's come back to the **SMART WORLD** stable coin.

As we said you can receive **STB** equal to 99 percent of your paid **STT**.

STB is always 1 **BITS** and convertible to **STTS**, Only 1 percent of **STT** is useless in this method.

The crypto currency fluctuation and the unique **STT** pricing are mostly controlled by the intermediates placing.

Now **STT** as the low volatility financial backing can be caused the **SMART WORLD** stable coin mining.

After **SMART WORD** presentation on the ICP platform, all the saved back up is converted to BITCOIN in the **SMART WORLD** contract and the STT production will be done only by BITCOIN depositing.

(SMART SWAP OR SMART EXCHANGE)

SMART WORLD uses the pancake swap for the exchanges on the BINANCE SMART CHAIN platform but there is a user interface in the **SMART WORLD** own page (SMARTWORLD.APP/SWAP)

The transactions confirmation and the information are guaranteed to be accurate on the block chains. The point is when we want to send out the insidious information from the block chain, how could we sure that when a user has sent a transaction request on the BITCOIN blockchain, we will pay off equivalent to its worth on the ETHERUEM blockchain with no errors?

Is there a way that the sent information is validated from the BITCOIN network to the ETHERUEM network, only if the ETHERUEM network can call the other block chains information and uses them decentralized. We are able to do that only when as soon as the request from the BITCOIN network exits, it moves to other blockchain. This intermediate block chain is ICP. We want to be the whole decentralized exchange blockchains.

THE DEAL METHOD IN THE CENTRALIZED AND DECENTRALIZED EXCHANGES

The individuals purvey their assets to the centralized exchange and the middleman does the transformation for them but in order to deal a token the people should import their properties to the smart contract codes so the others do the deals by this liquidity usage.

It is considered the interest payment plan for the STTS liquidity provider, so we don't need any business partners helping.

As the SMART SWAP launches, the created profit is divided between the STTS holders and it's paid by STT.

There is no need to freeze STTS for receiving profit. Every 100 million STTS holder is included the advantages.

THE SMART INVESTMENT

The minimum investment amount is 500/000 thousand SATOSHI (5000 STB) which can be paid by BNB, BTC or STTS at the payment moment.

As we mentioned the STT token is calculated for the holders equivalent to 200/000 SATOSHI in exchange for every 500/000 SATOSHI, and it will be paid during 2 years. As an example the first 10 received STT is equal to 1 SATS, the next 10 STT would be at least worth 2 SATS because of the price hiking.

The referral profit receiving form is the most important difference between STTS investment and BNB or BTC. We will receive 0.5 of our referral profit with STTS method by 500/000 invested SATOSHI But 0.4 percent of the referral profit will be activated via BNB or BTC investment.

At the beginning 4 percent is the maximum receivable profit via the personal investment increment.

There is no ceiling for the person income in the referral way. The person commission will be calculated up to 100 levels.

Smart pool

Tokens or pair tokens which involves profit in the SMART WORLD pool:

- STTS
- STB
- STTS/BNB
- STTS/STT
- STTS/STB
- BNB/STB
- STTS/BTC
- STB/BTC

THE SMART pool

STTS

The STTS Pool starts at least from 5000 amounts and its profit is 0.25 percent per week, as the STTS pool reaches to 1 million token numbers, it will be paid 0.5 percent profit weekly.

The STTS creators, as the founders must bring in at least 700 STTS to the pool. Thirty percent of the whole pool profit belongs to the founder and the left 70 percent is divided among the rest of the pool members.

Lock time: 1 year

Profit withdraw basis on a weekly

Annually profit 13 percent or 26 percent

Profit payment by STT or STB

STB

Annually benefit definitely at least 17 percent.

STTS/BNB

Annually benefit definitely at least 27 percent.

STTS/STT

Annually benefit definitely at least 37 percent.

STTS/STB

Annually benefit definitely at least 37 percent.

BNB/STB

Annually benefit definitely at least 19 percent.

STTS/BTC

Annually benefit definitely at least 27 percent.

STB/BTC

Annually benefit definitely at least 70 percent.

Everyone can build up their own tokens or their own pools but if the payment profits have been locked beforehand, whether it is their own token profit or the real profit like the stable coin.

FINANCIAL

THE STT FINANCIAL

The STTS liquidity provider program is according to the commission payment from 15 levels.

6872 STT is rewarded by freezing 70 STTS or BNB in 37 days, 0/00000005 will be paid on a first day and this number is going to be doubled every day, all the amounts of 6872 STT have been paid on the 37th day. The user can receive all of the locked assets and also the rewards after 37 days.

The users can directly introduce as many people as they want in the first level. The firm 2000 STT number in the first level and 1000 STT in the second level will be rewarded to the modifier for each person introduction. The fixed 500 STT number is paid as the commission from

3rd to 15th level for per person introducing. You will receive your referral profit under any circumstances during 37 days but every time that the STT price doubles you can no longer get your referral profit by the previous investment, for example it reaches from 2 SATS to 4 SATS. It means if you had paid 7 STTS and the BNB token equal to the STTS number at the registry time, now you have to lock the same amount for 37 days so you can gain your referral profit and also receive the other 6872 STT during 37 days.
